Brief Introductions about CFL:

Compact fluorescent lamp(CFLs) offer energy savings of 60% to 70% compared with incandescent lamps. But CFLs come in a variety of shapes-U, double-U, globe, spiral and some of the shapes are not as effeicent as straight fluorescent tubes. The staight fluoscent tubes that won energy-saving awards in china these years produce between 110 and 120 lumens per watt, while CFLs average just 55-65 lumens per watt. This makes the straight tubes more suitable for illuminating large rooms, while CFLs win out for household decorative applications.
